Kalyan Chakravarthi B

.NET Full Stack Developer
kalyan.bondala4@gmail.com | Bellevue, WA | linkedin

SUMMARY

.NET Full Stack Developer with 3+ years building event-driven, high-throughput integration systems on Microsoft Azure - C#/.NET Core services for Event Hubs stream processing, change-data-capture pipelines, and enterprise ERP (Dynamics 365 F&O) / EDI integration, paired with React front-ends. Delivered 9 production services spanning containerized workers, Azure Functions, and a 30+ screen React console, with a focus on data correctness, reliability, and zero-secret Azure security.

EDUCATION

Master of Science in Computer Science - University of Central Missouri, Missouri
Bachelor of Technology in Electronics and Communication Engineering - Jawaharlal Nehru Technological University, Hyderabad, India

SKILLS

Languages: C#, Java, TypeScript, JavaScript, T-SQL, Python
Frameworks & Runtimes: .NET 8/9/10, ASP.NET Core Web API, .NET Worker / BackgroundService, Azure Functions (isolated worker), React 18, Spring Boot, Node.js
Cloud (Azure): Event Hubs, ADLS Gen2, Azure SQL, Blob & Table Storage, Key Vault + Managed Identity, AKS, App Service, Container Apps, Functions, Document Intelligence, OpenAI, AI Language, Microsoft Fabric
Data & Messaging: EF Core, Dapper, ADO.NET, SqlBulkCopy, TVPs, stored procedures, Redis, PostgreSQL, MongoDB, EventProcessorClient, ERP (Dynamics 365 F&O) OData/DMF, Microsoft Graph, EDI 850/820/894, GraphQL
DevOps & Observability: Docker, Kubernetes, GitHub Actions, Jenkins, CI/CD, Application Insights, Serilog
Practices: Microservices, async / multithreading, feature-flag-gated delivery, distributed leader election, Agile / Scrum

PROFESSIONAL EXPERIENCE

Software Engineer | Taylor Farms *08/2024 - Present | Bellevue, WA*

- Architected and led a full-stack, event-driven email automation system using C#, .NET Core, and Azure, replacing manual entry by a 40-person team and reducing processing time by 90% and operational costs by 30%.
- Integrated Microsoft Graph API with webhook support to fetch ~750 daily emails from a shared Outlook inbox, processed serverlessly via Azure Functions; orchestrated move/tag/route logic to cut manual monitoring by 95%.
- Leveraged Azure AI Language (custom NER + classification) to extract structured order data with 98% accuracy, and Azure AI Document Intelligence to parse ~500 daily PDF attachments with automated validation.
- Deployed Azure OpenAI with Foundry Agents to generate dynamic customer email responses, automating ~80% of communication and improving reply time by 85%.
- Published processed data to Azure Event Hubs for real-time consumption by a ReactJS UI on AKS serving 40 internal users; built containerized .NET Core REST APIs on AKS for live order tracking, reducing user wait time by 70%, at 99.9% uptime with autoscaling that cut infrastructure costs by 25%.
- Built a multi-tenant change-data-capture Worker Service (.NET 10) replicating row-level ERP (Dynamics 365 F&O/BC) data changes into Azure SQL across ~100 ERP tables via batched JSON-shredding stored procedures and a config-keyed handler registry enabling zero-code stream onboarding.
- Engineered a streaming SqlBulkCopy replication pipeline (5,000-row batches, FastMember) into dynamically partitioned per-region staging tables, advancing the sync watermark only on full-batch success for at-least-once delivery.
- Designed a Redis-backed CDC engine computing row-level deltas with chunked hash writes so only modified rows emit Event Hub events, eliminating redundant traffic on multi-million-row CSV extracts across 15 regions.
- Architected a .NET 10 integration platform co-hosting an ASP.NET Core API and 5+ feature-flagged BackgroundService workers in one container, with Azure Blob-lease leader election and keyed-DI multi-tenant ERP access bridging Dynamics 365 F&O, Databricks, ADLS Gen2, and partner FTP/SFTP/email.
- Developed an EDI abstraction layer (~33K LOC) brokering EDI 850/820/894 and MOJO documents bidirectionally with the central ERP (Dynamics 365 F&O), using a database-driven XML-to-ERP transformation engine and a DB-backed retry state machine.
- Built a 30+ screen React 18 operations console with MSAL auth, a proactive JWT-expiry interceptor, and runtime feature-flag menu/route swapping without redeploys; secured all services with Key Vault + Managed Identity (zero connection-string secrets).

Software Engineer | C2S Technologies **07/2022 - 06/2023 |** *Hyderabad, India*

- Designed and developed REST-based microservices with Spring Boot and Java, improving deployment times by 50%.
- Migrated infrastructure from RedHat OpenShift to Azure Kubernetes Service (AKS), enhancing cost-efficiency and scalability.
- Automated CI/CD pipelines with Jenkins and integrated monitoring via Splunk, New Relic, and SignalFx for faster issue resolution.
- Applied GraphQL to consolidate API requests, improving response time by 40%.
- Led backend optimization projects that reduced service downtime by 30%, delivering high-quality code in agile sprints aligned with DevOps best practices.

TECHNICAL PROJECTS

- **Distributed Bigtable Database (Java) -** Built a distributed storage system with external sort/merge join operators for querying large datasets.
- **Social Media Anomaly Detection Platform (React, Node.js, Python, PostgreSQL) -** Used NLP/clustering to preprocess 500K+ tweets (5x speedup) and cut UI latency 40% for 50+ concurrent users.
